1,1-Dimethylhydrazine is primarily used as a high-energy fuel in military applications and as a rocket propellant and fuel for thrusters. Acute (short-term) inhalation exposure of humans to 1,1-dimethylhydrazine results in nose and throat irritation, mild conjunctivitis, nausea, and vomiting.

Low levels of methyl chloride occur naturally in the environment. Higher levels may occur at chemical plants where it is made or used. Acute (short-term) exposure to high concentrations of methyl chloride in humans has caused severe neurological effects.

Noise-induced hearing loss (NIHL) is hearing impairment resulting from exposure to loud sound. People may have a loss of perception of a narrow range of frequencies, impaired cognitive perception of sound including sensitivity to sound or ringing in the ears. When exposure to hazards such as noise occur at work and is associated with hearing loss, it is referred to as occupational hearing loss.
